

Faithful Temporal Question Answering over Heterogeneous Sources

Zhen Jia¹, Philipp Christmann², and Gerhard Weikum²

¹Southwest Jiaotong University, China ²Max Planck Institute for Informatics, Germany

FAITH is a faithful system for temporal QA providing explanatory evidence for answers

★ Lookups of *dates*

When was *Bohemian Rhapsody* recorded? **1975**

★ Questions with *explicit temporal constraints*

Record company of Queen **in 1975**? **EMI**

Record company of Queen **in 1990**? **Parlophone**

★ Questions with *implicit temporal constraints*

Queen's record company **when recording** *Bohemian Rhapsody*? **EMI**

Queen's record company **after Freddie Mercury's death**? **Parlophone**

⇒ Many QA systems falsely reply **EMI** by their popularity prior, being unfaithful to the temporal constraint in the question
 ⇒ Answer should satisfy **temporal constraints**

LIMITATIONS OF THE STATE-OF-THE-ART

- ☆ **Temporal constraints** matched solely in **latent space**
- ☆ **Answer derivation not explainable** for end users
- ☆ Operate only over a **single information source**, KB or text, inherently limiting the answer coverage of the QA system

FAITH

- ★ **Faithful answering** of temporal questions with time constraints, using novel mechanism for handling challenging **implicit questions**
- ★ **First temporal QA system** tapping into **heterogeneous sources** (Wikidata KB, Wikipedia text, tables, and infoboxes)
- ★ **Explainable answer derivations** and **explanatory evidence for answers**: answer traceable through entire system

FAITHFULNESS

- ★ **Structured modelling** of temporal information need
- ★ Transforming **implicit temporal constraints** into **explicit conditions** via the implicit question resolver
- ★ Dedicated **temporal pruning** of temporally incompatible evidence via **temporal rules**

After managing FC Nantes, which football club did Antoine Raab take on next?

Understanding

Model for Time-aware Structured Frame
 for generating *question entity, question relation, expected answer type, temporal category, and temporal signal*

Explicit Temporal Annotation
 to identify explicit temporal values

Implicit Question Resolver

for generating intermediate question(s) and recursively calling FAITH for answering them

Intermediate questions for resolving implicit constraint **Explicit temporal values**

"When Antoine Raab managed FC Nantes start date?" → **1946**

"When Antoine Raab managed FC Nantes end date?" → **1949**

Question entity: Antoine Raab, FC Nantes
Question relation: After managing which football club did take on next
Expected answer type: association football club
Temporal signal: after
Temporal category: implicit
Temporal value: [1946, 1949]

Structured Frame

Retrieval

Heterogeneous Retrieval

from Wikidata KB, Wikipedia text, tables and infoboxes

Evidences

Evidence Scoring

to prune out semantically irrelevant evidence

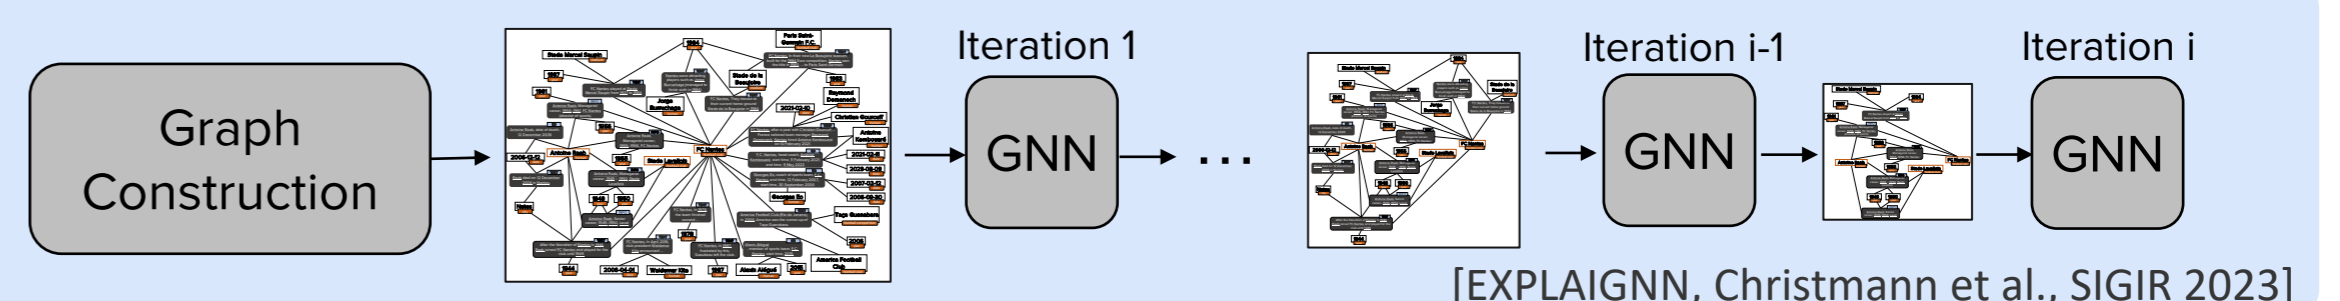

Temporal Pruning

to prune out temporally irrelevant evidence

Top-k Faithful Evidences

Structured Frame

Answering

Stade Lavallois

Supporting evidence for answers of intermediate questions (**1946** and **1949**)

- "Antoine Raab, managerial career, **1946-1949**, FC Nantes" [Wikipedia infobox]
- "Antoine Raab, after the liberation of Nantes in 1944, Raab joined FC Nantes and played for the club until **1949**" [Wikipedia text]

Supporting evidence for final answer (**Stade Lavallois**)

- "Antoine Raab, managerial career, **1949-1950**, Stade Lavallois" [Wikipedia infobox]

FAITH outperforms state-of-the-art on implicit questions, providing more faithful answers

🕒 TIQ Benchmark Construction

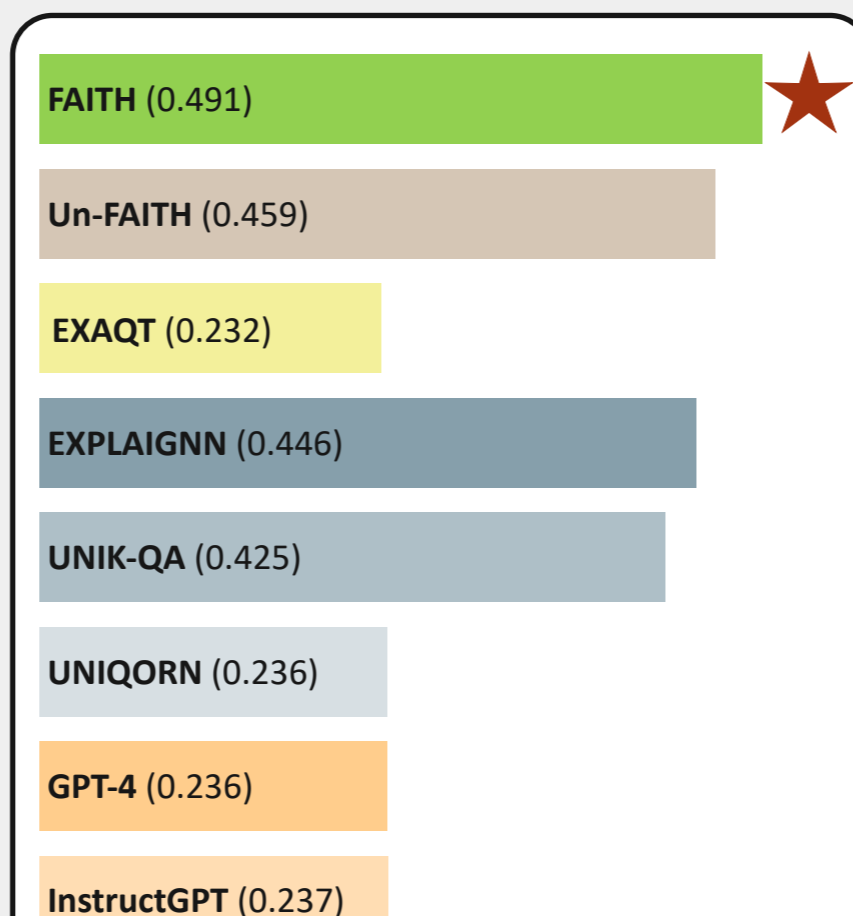

- ★ Automatic construction of implicit questions
- ★ Questions derived from multiple sources: Wikipedia text, infoboxes, and Wikidata KB
- ★ Configurable among various dimensions

🕒 TIQ Benchmark Characteristics

- ★ 10,000 implicit questions
- ★ 2,542 long-tail entities (<20 KB-facts)
- ★ 2,613 prominent entities (>500 KB-facts)
- ★ 2.45 question entities per question
- ★ 17.96 words per question

P@1 on 🕒 TIQ

(P@1: Precision at 1)

Faithfulness Evaluation

Comparing the faithfulness of FAITH and Un-FAITH for correct answers, and how often temporal constraints are violated or ignored.

Benchmark →	🕒 TIQ		TimeQuestions	
	Faithful	Temporally Unfaithful	Faithful	Temporally Unfaithful
Method ↓				
FAITH ★	0.95	0.00	0.94	0.01
Un-FAITH	0.90	0.08	0.87	0.13

Example: **What movies starring Taylor Lautner in 2011?** **Abduction**

Evidence provided by FAITH (faithful):

- "Taylor Lautner, Year is **2011**, Title is **Abduction**, Role is Nathan Harper" [Wikipedia table]

Evidence provided by Un-FAITH (temporal constraint not matched → temporally unfaithful):

- "Abduction, cast member, Taylor Lautner" [Wikidata KB]
